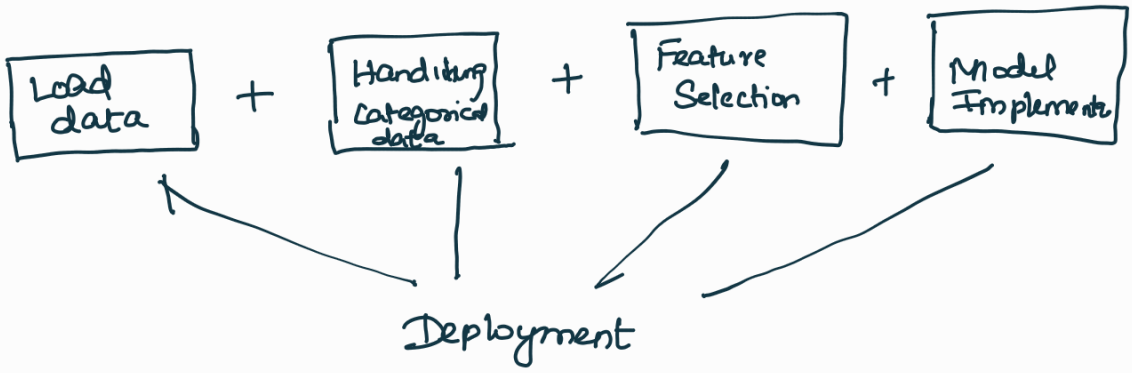
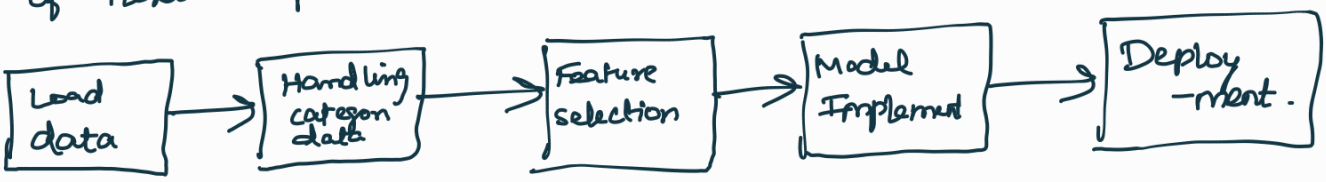
Machine Learning Pipeline.

The machine learning pipeline is mainly used if the model is for deployment (in production). Most of the company use ML pipeline for their model to make the process very easy.

Eg :-



Here each of the steps done individually, so in production, if we want to change anything we have to come to main programming & have to change each individual steps & their code which is very difficult in real time. So we go for ML pipeline where o/p of each step will be the i/p of next step.



The coding at deployment stage is very simple. If there any errors (or) change need to happen its very easy to change at one step than changing all steps to main programming.
